

SnapMetrics

SnapMetrics is a brand new JIRA app.

You can define metrics, and view the results in JIRA dashboards or serve them via REST services.

1. It is very easy to [define your metrics](#)
2. You can use each metric in your [metrics dashboard](#)
3. By default all metrics are run and cached by scheduled task which is triggered at 03:00 AM every day. However you can [re-schedule the executor](#) as you wish.
Or you can manually run a metric (in Metrics page) to force it cache latest value.
4. Every metric function can be done programatically by [Metrics REST Services](#)
